

Ragavendran S

Senior Full-Stack SDET | UI, API & Mobile Test Automation

+91-887-020-6167 • reachtoragavendrangs@gmail.com • linkedin.com/in/iamragavendrangs • github.com/iamragavendrangs

Summary

Full-stack SDET with 7+ years owning end-to-end quality across UI, API, and mobile testing, with hands-on AI engineering applied to test generation, QA tooling, and process automation. Consistently grows from individual contributor into the engineer other teams rely on for automation strategy, tooling decisions, and framework design, leading cross-functional squads, driving QA standards across teams, and coordinating with stakeholders across delivery cycles.

Delivered measurable impact at every role: cut manual coordination effort by 90% at Comcast through Power Automate, led a Playwright migration at iLink that reduced flaky tests by 48% and improved CI speed by 50%, and prototyped an LLM-powered test case generator at HCLTech that cut authoring effort by 60% and reduced requirement-to-test traceability gaps. Built synthetic test data pipelines that removed backend dependency during release validation.

- Built synthetic test data pipelines that eliminated backend dependency during release validation, cutting environment data wait time by 80% and unblocking release cycles across distributed teams.
- Owned full-stack test coverage across UI (Playwright, Selenium), API (REST Assured, Karate), and mobile (Appium, Android/iOS), achieving 50–82% automation coverage across platforms and companies.
- Led QA strategy and framework rebuild across 3 companies, managing and upskilling teams of 5 engineers into independent contributors while coordinating automation direction with engineering leads and delivery stakeholders.

Skills

Languages : Java • TypeScript • Python • JavaScript • SQL
UI Testing : Playwright • Selenium WebDriver • Cross-browser • Visual Regression • Accessibility Testing
API Testing : REST Assured • Karate • Postman • Contract Testing • Schema Validation
Mobile Testing : Appium (Android & iOS) • BrowserStack • Device Farm
Frameworks : Cucumber BDD • TestNG • Page Object Model • Allure Reports • JMeter
CI/CD & DevOps : Jenkins • GitHub Actions • GitLab CI • Azure DevOps • Docker • Maven • Git
AI & Tooling : FastAPI • GitHub Copilot • Windsurf • LLM Test Generation • Google Gemini • Vertex AI • BigQuery
Architecture : System Design • DSA • Design Patterns • Jira • Zephyr • Agile • Scrum

Experiences

iLink Digital, Chennai

Test Specialist

Jul 2025 – Present

- Reduced flaky tests by 48% and CI build time by 50% by migrating 200+ UI tests from Protractor to Playwright across 10 modules, validating critical screen flows, component interactions, and cross-browser rendering with visual regression checks.
- Expanded automation coverage to 82% (UI + API) by identifying and incorporating 20+ previously untested scenarios into regression suites, directly reducing defect volume reaching production validation.
- Cut manual verification by 40%/release by engineering Playwright POM-based validation flows with accessibility checks across login screens, multi-step onboarding forms, and core transactional pages.
- Conducted performance profiling with JMeter for client reviews, identifying latency bottlenecks across critical API endpoints under concurrent load.

HCL Technologies Limited, Chennai

Technical Lead

Mar 2025 – Apr 2025

- Reduced manual test authoring by 60% by building an LLM-powered test case generator (OpenAI API, FastAPI) that converts feature requirements into structured test scenarios, acceptance criteria, and automation skeletons.
- Designed QA automation playbooks and integration patterns for ML validation pipelines, producing a technical feasibility report with an adoption roadmap for reducing manual testing effort across future releases.

Comcast India Engineering Centre, Chennai

Software Development Engineer in Test – 3

Jun 2022 – Feb 2025

- Reduced incident triage time by 40% and partner coordination by 60% by building observability dashboards tracking pipeline failures, third-party vendor issues, and model regressions across a large-scale order fulfilment platform.
- Eliminated 90% of manual follow-ups for a 25-person cross-functional team by automating partner orchestration and validation workflows across ordering, tracking, and replacement journeys using Power Automate.
- Reduced compliance overhead by 30–50% by engineering JIRA JQL automation that standardized reporting workflows across multiple squads; earned Sky Stars Award from the platform's Assurance Lead.
- Validated data integrity across order fulfilment pipelines using SQL against production and staging databases, catching 15+ data transformation defects pre-release.

Software Development Engineer in Test – 2

- Scaled automation capability to 3 Agile squads by upskilling 5 engineers from low familiarity to independent framework contributors, eliminating single points of expertise with test execution tracked in Zephyr across all squads.
- Achieved 50% application coverage by refactoring legacy automation into a production-grade framework using Selenium

WebDriver, Java, REST Assured, Appium, TestNG and Cucumber, applying Page Object Model design to stabilize UI and integration tests across 15+ service endpoints with Allure and Extent Reports integrated into Jenkins.

- Added 30+ end-to-end test scenarios spanning UI, API, and service layers for ordering, tracking, and fulfilment workflows across both web interface and service layers, validated through contract testing and schema assertions.

Infosys Limited, Chennai

Test Engineer

Oct 2018 – Jun 2022

- Improved build feedback by 30% and reduced manual effort by 70% by owning Appium-based mobile test suites (Android + iOS) validated across device configurations on a large-scale transportation platform across multiple environments.
- Improved validation efficiency by 12% by implementing Karate API contract tests and log-based validation frameworks for backend data transformations, enabling faster defect resolution across distributed teams working across time zones.
- Investigated production issues by analyzing application logs, configuration files, and system behaviour, identifying root causes and providing development teams with reproducible findings and suggested fixes.
- Performed SQL-based backend validation verifying data consistency across ETL pipelines and service databases, flagging schema drift and transformation anomalies before release sign-off.

Senior Test Automation Executive

- Earned Rising Star Award by self-initiating the transition from manual to automated testing, independently learning and implementing UFT/QTP UI automation scripts on a safety-critical railway platform, directly reducing manual regression effort within the first year.
- Identified and reported 8% of total project defects with detailed JIRA documentation including reproduction steps, environment details, and suggested fixes, consistently accelerating development team resolution cycles.

Test Executive

- Executed manual functional testing and managed test suites using HP ALM across a safety-critical railway platform, documenting 18 verified defects with full traceability to requirements and test cases.
- Supported end-to-end STLC activities including test planning, test case design, execution, and closure, maintaining RTM coverage between business requirements and test execution results.

Projects

AI-Based Test Case Generator

github.com/iamragavendrants/test-case-generator

Problem: Manual test authoring from feature requirements was slow and created traceability gaps.

Solution: Built an LLM-powered tool using OpenAI API and FastAPI that converts requirements into structured test scenarios.

Impact: Reduced manual test authoring effort by 60% and improved requirement-to-test traceability across the team.

Test Data Provider Tool

github.com/iamragavendrants/simple-test-data-generator

Problem: Teams depended on backend engineers for test data, creating delays and blocking release cycles.

Solution: Developed an internal platform generating validated synthetic datasets for integration, API, and pipeline testing.

Impact: Cut environment data wait time by 80% and eliminated backend dependency during release cycles.

Retention Rocket (Client-hosted Hackathon)

Problem: Retention decisions were being made on gut feel despite rich behavioral data being available.

Solution: Prototyped an AI-driven churn prediction platform using Python, Google Gemini, Vertex AI, and BigQuery on GCP.

Impact: Surfaced data-driven retention strategies and earned a Client Honorary Mention from the client panel.

Awards

2025 – **Client Honorary Mention:** Built Retention Rocket, an AI-driven churn prediction prototype, at a client-hosted hackathon.

2024 – **Sky Stars Award:** Awarded for JIRA JQL compliance automation that reduced team overhead by 30-50%.

2023 – **Champ Award:** Automated Excel-based metrics improving operational reporting efficiency across teams.

2022 – **First Time Right:** Delivered automation scripts for a new feature achieving UAT sign-off with near-zero defects.

2021 – **Rising Star:** Self-initiated automation on a safety-critical platform, exceeding expectations within the first year.

Certifications & Education

- ISTQB® Certified Tester – Foundation Level
- Power BI – PwC Switzerland
- Data Science & Big Data Analytics – Dell EMC
- Innovation & Creativity – HMM
- Python for Data Science – IBM

Bachelor of Computer Application (BCA)

Jul 2015 – Apr 2018

Kalasalingam Academy of Research and Education, Krishnan Koil

- First Class with Distinction
- 2nd Place – Inter-college Product Innovation Competition
